Problem

Describe the structure of an *epistemic community*, e.g. of a scientific community.

- Groups of agents sharing a common set of subjects, concepts, notions, issues; a common goal of knowledge creation—Haas (1992)
- Consist of minor subcommunities, possibly not disjoint.
- Citations, co-authorship, terminology....
- Social and semantic aspects

Concept lattices Formal Concept Analysis (Ganter, Wille 1999)

A formal context $\mathbb{K} = (G, M, I)$

- set of objects G
- set of attributes M
- objects have attributes: relation $I \subseteq G \times M$

Derivation operators

For $A \subseteq G$ and $B \subseteq M$:

 $A' = \{m \in M \mid \forall g \in A : glm\}$ $B' = \{g \in G \mid \forall m \in B : glm\}$

Example: a concept lattice for a sample of 25 authors

69 concepts

Lattice pruning

Large lattices are hard to

compute

store

interprete

Some concepts of the lattice

- are due to noise in data
- reflect noninteresting details

Solutions

- keep an upper part of the lattice (large communities)
- discard "irrelevant" concepts
- use several representation levels

...or how likely it is that the intent is retained upon deletion of an arbitrary number of objects from the context:

$$\sigma(\mathbf{A}, \mathbf{B}) = \frac{|\{\mathbb{K}_{H} \mid H \subseteq \mathbf{G} \text{ and } \mathbf{B} = \mathbf{B}^{I_{H}I_{H}}\}|}{2^{|\mathbf{G}|}}$$

Computing stability

```
Concepts := \mathfrak{B}(\mathbb{K})
for each (A, B) in Concepts
 Count[(A, B)] := the number of lower neighbors of (A, B)
 Subsets[(A, B)] := 2^{|A|}
end for
while Concepts is not empty
 let (C, D) be any concept from Concepts with Count[(C, D)] = 0
 Stability[(C, D)] := Subsets[(C, D)] / 2^{|C|}
 remove (C, D) from Concepts
 for each (A, B) > (C, D)
  Subsets[(A, B)] := Subsets[(A, B)] - Subsets[(C, D)]
  if (A, B) \succ (C, D)
   Count[(A, B)] := Count[(A, B)] - 1
  end if
 end for
end while
return Stability
```

(日) (日) (日) (日) (日) (日) (日)

Stability: Properties useful for approximate computation

- Given a concept (*A*, *B*) of a context (*G*, *M*, *I*), if there is a set $A_1 \subset A$ such that $A'_1 \neq B$, then $\sigma(A, B) \leq 1 1/2^{|A \setminus A_1|}$.
- Given a concept (*A*, *B*) of a context (*G*, *M*, *I*), if there are two sets $A_1, A_2 \subset A$ such that $|A_1| = |A_2|, A_1 \neq A_2$, and $A'_1, A'_2 \neq B$, then $\sigma(A, B) \leq 1 \frac{3}{2^{|A| \setminus A_1|+1}}$.

◆□▶ ◆□▶ ◆□▶ ◆□▶ ● ● ● ●

Stability: Addition of new objects to the context

- Given a concept (A, B) of a context (G, M, I), if a new object g is added to form context (G ∪ {g}, M, J) (such that (G × M) ∩ J = I), then
 - 1. For an old concept (A, B), we have $\sigma_J(A, B) = \sigma_I(A, B)$.
 - 2. For a modified concept $(A \cup \{g\}, B)$, we have

$$\sigma_I(\boldsymbol{A}, \boldsymbol{B}) \leq \sigma_J(\boldsymbol{A} \cup \{\boldsymbol{g}\}, \boldsymbol{B}) \leq 1/2 + \sigma_I(\boldsymbol{A}, \boldsymbol{B})/2.$$

3. For a new concept (A, B), we have

$$\sigma_J(A,B) \left\{ \begin{array}{ll} = 1/2, & ext{if } B = \{g\}'; \\ < 1/2, & ext{otherwise.} \end{array}
ight.$$

Stability-based pruning

Lattice pruning

First, we simply delete concepts with the stability index below a threshold

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

Stability-based pruning

Lattice pruning

First, we simply delete concepts with the stability index below a threshold

A pruned lattice: from 1100+ to 25 concepts

200

Another example: ECCS 2006

Abstracts of papers presented at the European Conference on Complex Systems

- *G* is the set of authors: |G| = 401
- *M* is the set of terms: |M| = 109
- The concept lattice contains 6011 concepts
- Select the 25 most stable concepts

ECCS

- "network" is a central issue
 - "social network" (agent-based networks)
 - "structure network" (topological issues)
 - "interact network" (networks as representation of interactions)
 - "node network" (a node being a basic unit)
 - "dynamics network" (evolution of networks)
 - "model network" (modeling of networks).

ECCS

- "model" is an important topic
 - related to "agents", "simulation", and "dynamics"
 - "network dynamics model": scientists interested in the modeling of network dynamics (morphogenesis)
 - "model distribut": the use of models to reconstruct distributions of any kind
 - "model dynam process": the modeling of dynamical processes

ECCS

Isolated topics: minor fields focused on particular issues

- "algorithm": introduction and use of novel and general algorithms to achieve empirical measurements in a variety of cases
- "community": community and cluster detection

Nested line diagrams

Nested line diagrams

- We partition the set of attributes into two parts
- Internal and external parts of the lattice: The concept (A, B)"inside" the concept (C, D) corresponds to $(A \cap C, B \cup D)$

▲□▶ ▲□▶ ▲三▶ ▲三▶ - 三 - のへで

Nested line diagrams

Nested line diagrams

- We partition the set of attributes into two parts
- Internal and external parts of the lattice: The concept (A, B)"inside" the concept (C, D) corresponds to $(A \cap C, B \cup D)$

Nested line diagrams

Nested line diagrams

- We partition the set of attributes into two parts
- Internal and external parts of the lattice: The concept (A, B)"inside" the concept (C, D) corresponds to $(A \cap C, B \cup D)$

Combining nested line diagrams and stability-based pruning

We prune external and internal lattices using stability index

Pruned outer and inner lattices: topics vs. methods

Combining nested line diagrams and stability-based pruning

Nesting vs. zooming

- The stabilized nested line diagram shows how major methods are distributed among major topics
- Zooming: To see the most important methods for each topic, construct the lattices of methods for the populations (extents) of individual topics
- "dynamics" vs. "control"

◆□▶ ◆□▶ ◆□▶ ◆□▶ ● ● ● ●

Variants of stability

Intensional stability:

$$\sigma(\mathbf{A}, \mathbf{B}) = \frac{|\{\mathbf{C} \subseteq \mathbf{A} \mid \mathbf{C}' = \mathbf{B}\}|}{2^{|\mathbf{A}|}}$$

Extensional stability:

$$\sigma_{\theta}(A,B) = \frac{|\{D \subseteq B \mid D' = A\}|}{2^{|B|}}$$

Generalized stability ($A_H = A \cap H$ and $B_N = B \cap N$):

 $\frac{|\{(H, N, J) \mid H \subseteq G, N \subseteq M, J = I \cap (H \times N), A_H^J = B_N, B_N^J = A_H\}|}{2^{|G| + |M|}}$

Variants of stability

Intensional stability:

$$\sigma(\boldsymbol{A},\boldsymbol{B}) = \frac{|\{\boldsymbol{C} \subseteq \boldsymbol{A} \mid \boldsymbol{C}' = \boldsymbol{B}\}|}{2^{|\boldsymbol{A}|}}$$

Extensional stability:

$$\sigma_{e}(\mathbf{A}, \mathbf{B}) = \frac{|\{D \subseteq \mathbf{B} \mid D' = \mathbf{A}\}|}{2^{|\mathbf{B}|}}$$

Generalized stability ($A_H = A \cap H$ and $B_N = B \cap N$):

 $\frac{|\{(H, N, J) \mid H \subseteq G, N \subseteq M, J = I \cap (H \times N), A_H^J = B_N, B_N^J = A_H\}|}{2^{|G| + |M|}}$

Variants of stability

Intensional stability:

$$\sigma(\boldsymbol{A},\boldsymbol{B}) = \frac{|\{\boldsymbol{C} \subseteq \boldsymbol{A} \mid \boldsymbol{C}' = \boldsymbol{B}\}|}{2^{|\boldsymbol{A}|}}$$

Extensional stability:

$$\sigma_{e}(\boldsymbol{A},\boldsymbol{B}) = \frac{|\{\boldsymbol{D} \subseteq \boldsymbol{B} \mid \boldsymbol{D}' = \boldsymbol{A}\}|}{2^{|\boldsymbol{B}|}}$$

Generalized stability ($A_H = A \cap H$ and $B_N = B \cap N$):

$$\frac{|\{(H, N, J) \mid H \subseteq G, N \subseteq M, J = I \cap (H \times N), A_H^J = B_N, B_N^J = A_H\}|}{2^{|G| + |M|}}$$

Variants of stability

Intensional stability:

Modeling dynamics

- Static approach: comparing taxonomies that correspond to different time periods
- Dynamic approach: each elementary change in the data base should be mapped to a modification of a change in community representation
